## SKILLS

**Languages:** TypeScript, Python, JavaScript, C++, C, Kotlin, Swift, Java  
**Frontend:** Full-Stack Development, Frontend Development, Modern Web Applications, Responsive UI  
**Backend:** REST API Development, API Design, Microservices, Distributed Systems, Scalable Backend Services  
**AI:** Generative AI, AI Integration, AI-Powered Features, AI-Native Products, Rapid Prototyping, Semantic Kernel, Semantic Search, Vector Indexing, AI Coding Assistants (Claude Code, Cursor, Codex)  
**Cloud:** AWS, Microsoft Azure, Kubernetes, Container Orchestration, Cloud-Native Systems, CI/CD  
**Databases:** PostgreSQL, Relational Databases, NoSQL Databases, Query Optimization, Indexing  
**Engineering:** System Design, Scalable Architecture, High Availability, Reliability, Performance Optimization, Security, Monitoring, Observability, Code Reviews, Technical Design, Experimentation, Rapid Shipping, End-to-End Ownership

## EXPERIENCE

- Meta

May 2025 – Present

Full-time

- Full-Stack Software Engineer, AI-Native Product Systems*
    - Built and shipped improvements for **AI-native** product workflows across **backend services**, internal **REST APIs**, and large-scale **distributed systems**, enabling faster iteration on user-facing functionality in a high-ambiguity environment.
    - Accelerated asynchronous service integrations for **scalable applications**, lowering end-to-end latency by **18%** and improving responsiveness for product-facing experiences that required rapid development, end-to-end ownership, and reliable execution.
    - Partnered with engineering and product teams to translate ambiguous requirements into production-ready enhancements, shortening iteration cycles through tighter feedback loops, clearer technical design, and faster delivery across evolving priorities.
    - Expanded **monitoring**, **observability**, and release validation for production systems, reducing debugging and root cause analysis time by **35%** and strengthening reliability for fast-moving launches and experimentation-heavy workflows.
- NetApp

Feb 2025 – Apr 2025

Internship

- Full-Stack Software Engineer, Cloud and Distributed Product Systems*
    - Implemented core **backend** components for enterprise **distributed systems** in **Java** and **C++**, improving concurrency-safe request handling and memory-efficient processing for storage workflows handling **10k+** records per cycle.
    - Eliminated crash paths, contention hotspots, and execution bottlenecks in **Unix/Linux** services, reducing failure rates by **45%** and improving runtime **performance**, stability, and **reliability** under sustained production load.
    - Expanded service quality through structured **testing**, debugging, and peer-reviewed code changes, increasing confidence in internal integrations and strengthening scalable communication across platform and storage services.
- Viasat Global

Jun 2024 – Dec 2024

Full-time

- Full-Stack Software Engineer, Secure Communications Product Systems*
    - Developed secure communication **services** with authenticated **REST APIs** and resilient client-server integrations, increasing message delivery **reliability** by **37%** across distributed workflows serving real-time production use cases.
    - Optimized client and **backend services** through CPU and memory profiling, concurrency tuning, and removal of blocking execution paths, reducing **ANRs** by **52%** and improving **performance** and scalability for customer-facing experiences.
    - Advanced release quality with automated **testing**, diagnostics, and deployment validation, increasing pre-release defect detection by **33%** and reducing post-release regressions by **30%** across secure distributed applications.
- Cheeni Labs

June 2022 – Jul 2023

Full-time

- Full-Stack Software Engineer, Zero-to-One Product Applications*
    - Launched consumer-facing Android features in **Kotlin** for a zero-to-one product, increasing engagement by **42%** and reducing message latency by **34%** through improved synchronization, state consistency, and rapid feature iteration.
    - Designed backend-connected notification workflows using Firebase Cloud Messaging and internal **REST APIs**, achieving **97%** delivery reliability while improving **scalability**, runtime stability, and responsiveness across varied device states.
    - Elevated application quality through biometric authentication, encrypted credential storage, and automated UI and integration **testing**, raising coverage to **88%** and reducing UI defects by **32%** in fast release cycles.
    - Iterated closely with product and design on customer feedback, shipping features quickly and improving end-to-end execution across mobile workflows and backend-integrated product surfaces in a startup-style environment.

## EDUCATION

- San Jose State University

San Jose, United States

- Master of Science - Software Engineering*

Aug 2023 - May 2025
- Gandhi Institute Of Technology (GITAM)

Visakhapatnam, India

- Bachelor of Engineering - Computer Science*

Aug 2018 - May 2022

## PROJECTS

- AI Feature Experimentation Studio

Jan 2025 – May 2025

- Academic Project*
    - Developed an **AI-native full-stack application** with **React**, **TypeScript**, and **Python** to rapidly prototype customer-facing workflows, run **A/B tests**, and capture structured user feedback, reducing feature validation time by **41%**
    - Integrated **LLM features**, prompt versioning, and **REST API** evaluation pipelines using **Cursor** and **Claude**, improving response quality by **29%** and reducing prototype delivery time by **36%**.
- AI-Powered Customer Insights Workspace

Aug 2024 – Dec 2024

- Academic Project*
    - Engineered a **scalable full-stack application** using **React**, **TypeScript**, **Python**, and **SQL** to analyze product usage signals and surface actionable insights, reducing manual analysis time by **38%** and improving decision turnaround by **31%**.
    - Assembled **microservices**, **API design**, and **AWS**-based deployments with **Docker** to support low-latency AI workflows and production-style experimentation, increasing query throughput by **27%** and improving system reliability by **24%**.
